## Claims

[c1]

1. A time-domain communication system for use in an ultrasonic imaging system, the time-domain communication system comprising:
an ultrasonic array having a plurality of ultrasonic array outputs;
a time-domain multiplexer having an input connected to each of the plurality of ultrasonic array outputs and having a multiplexer output, the time-domain multiplexer continually cycles through each of the plurality of ultrasonic array outputs at a predetermined frequency connecting each of the plurality of ultrasonic array outputs to the multiplexer output for a predetermined amount of time wherein the plurality of ultrasonic array outputs comprises a first number of outputs and the multiplexer output comprises a second number of outputs, the first number of outputs being greater than the second number of outputs;

a de-multiplexer having an input connected to the multiplexer output, the de-multiplexer having a plurality of de-multiplexer outputs, the de-multiplexer continually cycles through each of the plurality of de-multiplexer outputs at the predetermined frequency connecting each of the plurality of de-multiplexer outputs to the multiplexer output for the predetermined amount of time wherein the plurality of de-multiplexer outputs comprises a third number of outputs, the third number of outputs being greater than the second number of outputs;

a time gain control amplifier connected to each of the plurality of demultiplexer outputs and amplifying each respective signal in each of the plurality of de-multiplexer outputs;

an analog to digital converter connected to the time gain control amplifier wherein each respective signal in each of the plurality of de-multiplexer outputs is converted to a digital signal at a sample frequency rate; and a timing reference connected to the time-domain multiplexer, the de-multiplexer and the analog to digital converter for providing a single timing reference to determine at least the predetermined frequency and the sample frequency rate.

2. The system of Claim 1 wherein the analog to digital converter is connected to image processing electronics for generating an ultrasonic image.
3. The system of Claim 1 wherein the ultrasonic array comprises a plurality of cables bundles wherein each of the plurality of cable bundles includes at least one ultrasonic array output of the plurality of ultrasonic array outputs.
4. The system of Claim 3 wherein the time-domain multiplexer comprises a plurality of time-domain multiplexers and the de-multiplexer comprising a plurality of de-multiplexers, each of the plurality of time-domain multiplexers having a multiplexer output wherein each of the plurality of time domain multiplexers are connected to a respective one of the plurality of cable bundles and the multiplexer output of each of the plurality of time-domain multiplexer being connected to a respective one of the plurality of de-multiplexers.
5. The system of Claim 1 wherein the predetermined frequency comprises the sample frequency rate times the first number of outputs.
v ·
6. A time-domain communication system for use in an ultrasonic imaging system, the communications system comprising: an ultrasonic probe comprising; an ultrasonic array having a plurality of ultrasonic array outputs; and a time-domain multiplexer having an input connected to each of the plurality of ultrasonic array outputs and having a multiplexer output wherein the time-domain multiplexer continually cycles through each of the plurality of ultrasonic array outputs at a predetermined frequency connecting each of the plurality of ultrasonic array outputs to the multiplexer output for a

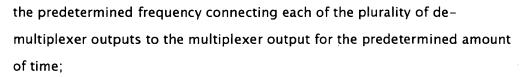

having a plurality of de-multiplexer outputs wherein the de-multiplexer

continually cycles through each of the plurality of de-multiplexer outputs at

[c8]

[c9]

[c13]

a timing reference connected to the time-domain multiplexer and the demultiplexer for providing a single timing reference to determine at least the predetermined frequency.

- [c7] 7. The system of Claim 6 wherein the plurality of ultrasonic array outputs comprises a first number of outputs and the multiplexer output comprises a second number of outputs, the first number of outputs being greater than the second number of outputs.
  - 8. The system of Claim 7 wherein the plurality of de-multiplexer outputs comprises a third number of outputs, the third number of outputs being greater than the second number of outputs.
    - 9. The system of Claim 6 further comprising a time gain control amplifier connected to each of the plurality of de-multiplexer outputs and amplifying each respective signal in each of the plurality of de-multiplexer outputs.
- [c10] 10. The system of Claim 9 further comprising an analog to digital converter connected to the time gain control amplifier and the timing reference wherein each respective signal in each of the plurality of de-multiplexer outputs is converted to a digital signal at a sample frequency rate.
- [c11] 11. The system of Claim 10 wherein the analog to digital converter is connected to image processing electronics for generating an ultrasonic image.
- [c12] 12. The system of Claim 6 wherein the ultrasonic array comprises a plurality of cables bundles wherein each of the plurality of cable bundles includes at least one of the plurality of ultrasonic array outputs.
- 13. The system of Claim 12 wherein the time-domain multiplexer comprises a plurality of time-domain multiplexers and the de-multiplexer comprising a

plurality of de-multiplexers, each of the plurality of time-domain multiplexers having a multiplexer output wherein each of the plurality of time domain multiplexers are connected to a respective one of the plurality of cable bundles and the multiplexer output of each of the plurality of time-domain multiplexer being connected to a respective one of the plurality of de-multiplexers.

[c14]

14. A method for time-domain communication in an ultrasonic imaging system, the method comprising the steps of: acquiring ultrasonic data from an ultrasonic array; transmitting the ultrasonic data via a plurality ultrasonic array outputs to a time-domain multiplexer having an input connected to each of the plurality of ultrasonic array outputs, the plurality of ultrasonic array outputs comprising a first number of outputs; continually cycling through each of the plurality of ultrasonic array outputs at a predetermined frequency to connect and transmit the ultrasonic data from the plurality of ultrasonic array outputs to at least one multiplexer output for a predetermined amount of time, the at least one multiplexer

connecting the at least one multiplexer output to a de-multiplexer having a plurality of de-multiplexer outputs, the plurality of de-multiplexer outputs comprising a third number of outputs wherein the third number of outputs is greater than the second number of outputs;

output having a second number of outputs wherein the first number of

outputs is greater a second number of outputs;

continually cycling through the plurality of de-multiplexer outputs at the predetermined frequency to connect each of the plurality of de-multiplexer outputs to the at least one multiplexer output and to transmit the ultrasonic data from the multiplexer output to the plurality of de-multiplexer outputs; amplifying the ultrasonic data in the plurality of de-multiplexer outputs; converting the ultrasonic data to digital ultrasonic data at a sampling frequency rate; and

creating an ultrasonic image from the digital ultrasonic signal.

- [c15] 15. The method of Claim 14 wherein the predetermined frequency comprises the sample frequency rate multiplied by the first number of outputs. [c16] 16. The method of Claim 14 wherein the predetermined frequency and the sample frequency rate are provided by a timing reference. [c17]17. A method for time-domain communication in an ultrasonic imaging system, the method comprising the steps of: acquiring ultrasonic data from an ultrasonic array; transmitting the ultrasonic data via a plurality ultrasonic array outputs to a time-domain multiplexer having an input connected to each of the plurality of ultrasonic array outputs wherein the plurality of ultrasonic array outputs comprising a first number of outputs; continually cycling through each of the plurality of ultrasonic array outputs at a predetermined frequency to connect and transmit the ultrasonic data from each of the plurality of ultrasonic array outputs to at least one multiplexer output for a predetermined amount of time; connecting the at least one multiplexer output to a de-multiplexer having a plurality of de-multiplexer outputs; and continually cycling through the plurality of de-multiplexer outputs at the predetermined frequency to connect each of the plurality of de-multiplexer outputs to the at least one multiplexer output and to transmit the ultrasonic data from the multiplexer output to the plurality of de-multiplexer outputs. [c18] 18. The method of Claim 17 wherein the at least one multiplexer output has a second number of outputs and the first number of outputs being greater a second number of outputs. [c19] 19. The method of Claim 18 wherein the plurality of de-multiplexer outputs
- [c20] 20. The method of Claim 17 further comprising the step of amplifying the ultrasonic data output from the plurality of de-multiplexer outputs.

greater than the second number of outputs.

comprises a third number of outputs and the third number of outputs is

[c21]	21. The method of Claim 17 further comprising the step of converting the ultrasonic data to digital ultrasonic data at a sampling frequency rate.
[c22]	22. The method of Claim 18 further comprising the step of creating an ultrasonic image from the digital ultrasonic signal.
[c23]	23. The method of Claim 18 wherein the predetermined frequency comprises the sampling frequency rate multiplied by the first number of outputs.
[c24]	24. The method of Claim 18 wherein the predetermined frequency and the sampling frequency rate are provided by a timing reference.
